The ATIFlash utility is a specialized BIOS upgrade utility that will manage the flash operations on ATI graphics cards. It is intended to be used exclusively by computer users who own ATI graphics cards and it will help them to flash their graphics cards' BIOS without significant efforts. It requires that the target computer has a BIOS upgrade option when it is first powered on. To make this application work, its user interface will require that the computer was using one of the operating systems listed below when it was first powered on: It supports Windows XP (32-bit & 64-bit), Windows Vista (32-bit), Windows 7 (32-bit & 64-bit), Windows 8 (32-bit & 64-bit), and Windows 8.1 (32-bit & 64-bit). ATIFlash Features: ATIFlash was designed to be easy-to-use and it is basically a CLI (Command Line Interface) that provides a brief description of its functions when invoked without any additional arguments. It can be of utmost use to computer users who own ATI graphics cards, but it is available for free download and anyone is allowed to use it to flash their ATI graphics cards' BIOS. The following are the functions of the application: \*Upgrade BIOS This function can be used to check whether the target BIOS is compatible with ATIFlash, and if it isn't, it will offer an upgrade function that will help users to upgrade their BIOS. Users can also use this function to check the BIOS version. \*Flash BIOS This function will allow users to flash their target ATI graphics card's BIOS to its newest version, but it will require that their video card's BIOS has the same version as the one downloaded when they used the ATIFlash utility. \*Monitor BIOS Info If the user uses the ATIFB command line tool, then the following commands are available for monitoring the card's BIOS: \*version (show current BIOS version) \*enable (shows if the card is currently flashing) \*button (shows if the flashing is currently in progress) \*stop (shows how the current flashing is terminated) \*num (shows the currently available flash method) \*disable (shows if the flash was successfully done) \*mute (shows if the GPU

was successfully disabled) \*reset (shows if the card was successfully reset) \*test  
(shows if the current GPU is working properly) \*search (shows whether the BIOS  
supports searching for the BIOS files) 91bb86ccfa

## ATIFlash For PC [April-2022]

ATIFlash 1.1.9.0 is a solution designed to help users upgrade their ATI graphics cards' BIOS without much efforts. As its name clearly states, this utility is designed to work exclusively with ATI graphics cards. It will help users improve their cards' capabilities or fix any problems that might trouble them. With the help of ATIFlash, users will be able to easily upgrade their ATI cards' BIOS without installing any extra software on their systems. It might be considered as a rather simple application, but as is always the case, more functionality can be achieved when users start using it the right way and when they provide it with 100% accurate information about their systems, otherwise we might be responsible for the damage that might be incurred during the operation. The application doesn't require to be installed on the target computer, since it comes in an archive and simply unpacking it and launching the executable should be enough to use it as intended. It should be noted that 64-bit systems aren't supported by ATIFlash.

Sick and tired of waiting for the next big franchise to come along and save our apps for you? If so then you're in luck, because Java 7 will deliver a 12-factor app of its own. The JetBrains team this week released experimental support for Java 7 into IntelliJ Idea – the developers' workbench – and the IDE will now have access to the new technology. The JetBrains guys have been testing the Java 7 features for some time now, and they're fairly confident this is going to bring the benefits that Java 8 will bring. The major upside is that Java 7 means you can start using things like try with resources, functional interfaces and varargs. These are all features that have now been supported in Java for over two years, but are only now being fully delivered. Here's the full list of planned Java 7 features, from JetBrains: Further support for lambda expression Further support for generic variance on method parameters Method reference to expression (very similar to Function of other languages) Method reference to an operator (very similar to the Functional Interface of other languages) Wrapper for SQL or JDBC that can be passed to PreparedStatement or CallableStatement Wrapper for REST resource that can be passed to HttpURLConnection So what will these features actually bring? At the end of the day, Java 7

### What's New in the ATIFlash?

\*1) FwFiles that are located inside the archive should be extracted into the root directory of the computer. Also, it is highly recommended to perform a scan of the system before attempting to flash the BIOS through this program. \*2) Launch

---

FwUi.exe and let it scan the system. Follow its suggestions while it tries to find your graphics card's BIOS folder. ATIFlash should detect your graphics card's BIOS folder through scanning. \*3) If ATIFlash detects the BIOS folder of your graphics card, select the option that says "Open this folder". Next, click on the link that says "Flash the BIOS with ATIFlash for a ATI card", and follow the suggested settings. \*4) Once finished, click on the "Flash button". Now, wait for the whole process to finish. \*5) Reboot the PC and check to see if the BIOS has been updated successfully. CloverSoft
