Dependency Walker Description: The Dependency Walker is an application that checks if the classes in an Eclipse project are used correctly. It scans the project for references and violations of the Java Language Specification and any external API declarations. It uses a strict compilation model so that any class for which a violation is detected can be reported immediately. The application scans your project for any direct or indirect references to classes that are not found in a standard JDK. A direct reference is defined as the inclusion of an entire Java package, class or interface file in the classpath. An indirect reference is defined as an import in a class or interface file. Why are Ligatures Used? What is a ligature? I've been seeing a lot of posts recently on building SQLite databases with C#. I thought this would be a good occasion to talk a bit about SQLite and how to do basic inserts, updates, and queries. I have a book about SQLite that I've been reading through, but it is incredibly detailed. Because of this, I'm not going to go into a ton of detail about how SQLite works, or how to create tables and do basic inserts, updates, etc. Hopefully this video will be a good enough primer for you. I also assume you have an understanding of how to build databases and access them. If you haven't learned those skills yet, I'd recommend you look up some basic tutorials. Sqlite Basics Intro This is a different kind of video. It's not a tutorial. There are no instructions to follow. It's more of a conversation. I ask a question, you answer. That is it. This is an invitation for you to share what you know and what you think. This is also for me to learn from you. I'd love to hear from you, hit me up in the comments below. The JNI Native Access Library (JNA) is an integral part of the Apache Harmony Project. The JNA provides Java programs with native system calls and services that may be absent from a Java platform implementation. JNA allows the user to call native code from Java programs. JNA can be used for a variety of native functions. While some functions

operate on data, others manipulate files, resources and sockets. It can perform cryptographic operations, handle file and socket I/O, and process network connections. The JNA project was started in 1999 by Thomas Leonard. It became a part of Apache Harmony in 2001. This presentation provides an overview of JNA and its use in Hadoop. For more details on this presentation please see the slides. This chapter discusses the key 1d6a3396d6
