Hack Exploit Download.Q: How to plot this function in matlab? We are given the following function: $f(x)=x(1-\frac{\log(x)}{100})$ and we must plot this function between $0 \leq x \leq 10$ How can I do this? A: The first thing is to use a vectorized function. You don't need for-loops for your kind of task. The second thing is to use logarithmically scaled range. `xlim = [0, 10]; x = linspace(0, 10, 100); f(x) = x(1-log(x)/100); plot(x,f(x),'b-'); xlim(xlim); % keeping ylim axis([0 10 0 1])` If you do not use `xlim(xlim)`, you will need a loop to adjust the xlim to the range between 0 and 10. There are also other ways to do the task. I gave you one for vectorized usage of logarithmically scaled function. The most straightforward way is to find an expression of the function and plot that (`plot(0, f(0), 'b-'); xlim(xlim); axis([0 10 0 1])`) The field of the invention relates generally to aircraft winglets and more particularly, to a shaded structural deck member for a winglet utilized to reduce drag on the winglet. As is well known, aircraft are extremely complex mechanical structures, having large and highly sophisticated systems that operate within the harsh and extreme environments of the atmosphere. For example, an aircraft wing uses airfoils (e.
