For example: A: The above code works, but it is unclear why you need to use it. A namespace normally is only used to reference a namespace in the stylesheet, to add that namespace to the result of an expression you need to use an extension function for that: This will output the URI of the type. You can now use that information to get the types of the current element. You can use a for-each to loop over all attributes of an element, and get their type. For example: UN 0cc13bf012

The push for more transparency comes amid a renewed call by some businesses and environmentalists for the EPA to release key annual emissions data, known as Inventory of U.S. Greenhouse-Gas Emissions and Sinks, or Inventory, as soon as next month instead of later this year as has been the case since the E.P.A. began releasing the data after the 1990 Clean Air Act Amendments. President Barack Obama's new administration has said it wants to align U.S. data-gathering efforts with the European Union's reporting requirements for the largest carbon dioxide emitters. "We're trying to get this data as fast as we can, so we are submitting a request to the banks and exchanges to give us more information as soon as possible on the financial statements of the top 250 emitters, which should be by the end of March," EPA spokesman Michael Abboud said on Friday. The EPA also asked a federal bankruptcy court to release those financial statements. The requests for information, disclosed by EPA, come as environmental groups urge the agency to shift course and publish the data before the presidential election in November. "There's no other country that regulates their emissions like the United States. They are among the world's worst," said Larry Schweiger, president of the U.S. Chamber of Commerce's Institute for 21st Century Energy, in an interview on Friday. "It's hard to understand why they're constantly putting their foot in their mouth," he said. "It is a costly burden on the U.S. economy to collect this data. We are already sick and tired of it." The EPA said it would publish the data as soon as it has

Enjoy.Q: What is NP 's undecidability status for counting the number of times it occurs in a language (i.e., $L(A) = |A|$)? In comments to an answer to a similar question, WoLLI was conjectured to be NP -complete, and @AliceStolldorf mentioned that WoLLI is also NP -hard. Given a promise problem L , the problem is whether or not $L \in \mathsf{NP}$. If, instead of a promise problem, we consider the problem $L(A) = |A|$, then the problem of verifying that $L(A) = |A|$ is equivalent to L being in NP , but it is not equivalent to $L \in \mathsf{NP}$. In particular, $L(A) = |A|$ is undecidable, since $|A| = 0$ is a decidable language. Question: What is NP 's undecidability status for counting the number of times it occurs in a language (i.e., $L(A) = |A|$)? That is, is the problem $L(A) = |A|$ decidable? A: The $L(A) = |A|$ problem is decidable for any language L and integer a : Let L_a be the language consisting of strings w satisfying $|w| = a$ for which there is $x \in L$ with $w = x_a$. Then $L(A) = |A|$ is equivalent to $L(L_a) = a$. By the Cook-Levin theorem, $L(L_a) = a$ is decidable. In addition, L_a
