Adobe has Photoshop, Lightroom, and Photoshop CS or CS2. They are the most common. Photoshop and Lightroom are both useful, and you might find that your client only needs one or the other. Using Layers Layers are the foundation of all image manipulation in Photoshop. You can create an image by adding layers of color, texture, and so on. In the following sections, I show you how to work with layers and the commands that allow you to manipulate these layers. I explain how to modify color, how to apply levels or curves, how to resize an image, and how to use layers to texture an image. Seamlessly working with layers One of the great benefits of Photoshop is that you can manipulate an image using layers. This allows you to modify parts of your image — say, a detail — without destroying the other parts of the image. Layers are a lot like computer screens on your desktop: As you work, you can create, modify, and update the layers in the background. When you're done working, you can save your work as a new file, or you can discard the original image if you don't want to keep the changes you've made. In this book, I use the default Photoshop file format, Adobe's Portable Document Format (PDF). Using the Portable Document Format means that you can open your work in different versions of Photoshop and other Adobe applications. This is a great way to work on your images because you can always go back to your original file for further work. You can also access your files using the Adobe Bridge or Adobe Lightroom program, which makes it easier to access and manipulate images. Adobe Photoshop's layers feature is particularly useful if you're new to image editing and manipulation. To work with layers, you must first create a new file that contains layers. As I cover in Chapter 9, a new file is created by clicking File=New. But before you click the New button, navigate to the image that you want to create a new file for. You don't need to have an image open in Photoshop to create a new file. You just need to select the image in the Photoshop workspace. After you create a new file and navigate to the image that you want to use, click File=Save As and navigate to the new file. This saves the new file to your hard drive. In the illustration below, I create a new file called create.psd

### What's New In Photoshop CC 2015?

The present invention relates to a system for automating the verification of work instructions for processing through an automated system. More particularly, the present invention relates to a system for automating the verification of work instructions through the use of a computer. Laser printing systems have become important technologies in recent times in the printing industry. Laser printing systems include conventional computer-operated printers and those that are operated by skilled human operators. Laser printing systems and the work instructions for processing sheets of paper or other materials are commonly known as work instructions. A conventional computer-operated laser printing system includes one or more laser printers, a processor, a number of input and output devices and a host computer. A portion of the host computer's processing power is dedicated to developing work instructions. Conventional laser printing systems are only capable of processing work instructions created at a predetermined speed. As a result, a skilled human operator is required to develop and supply the work instructions for use by the system. The development of the work instructions requires the operator to utilize his knowledge and experience to generate work instructions within a particular time frame. When the operator develops work instructions on a regular basis, the operator develops a well defined pattern for accomplishing the work instructions in a sequential manner. When a skilled human operator develops work instructions, it is difficult for the operator to improvise. To the degree that the operator can improvise, the quality of work instructions is not uniform. Even when the operator uses his knowledge of the expected characteristics of work instructions to initially develop a work instruction, it is not possible for the operator to ensure that the work instruction will always operate in a reliable manner. Improper development and supervision of work instructions can result in defective work instructions. There is a need, therefore, for an automated system for processing work instructions. The need exists for a system capable of processing work instructions that are predefined in a predetermined manner. The need exists for a work instruction processing system that is capable of processing work instructions in an optimum manner and one that is not dependent on the knowledge and experience of a skilled human operator.
