What's New in the?

Computers take many forms, and have been heretofore of varying types, uses, sizes, shapes, and of varying functionalities and utility. Early computers contained few, if any, useful input devices. In that early era, input was carried out using function keys. While such devices have been somewhat replaced by a mouse, a keyboard remains the primary input device for computers used for word processing, data collection, and related tasks. Keyboards tend to be large and, in many instances, have dedicated uses. For instance, a number of keyboards are designed for typewriters, whereas many computers employ a "QWERTY" key arrangement for input. Some computers do not include a keyboard, either in part or entirely. One advantage of such computers is that the computers may be conveniently portable. In designing portable computers it would be an advantage to be able to selectively utilize both keyboard and mouse input devices. In a portable computer, the keyboard must be of relatively light construction, and thus occupies a relatively large amount of space. In many instances, it is not possible to place a keyboard on the top surface of a portable computer, and thus a mouse or some other type of input device must be used in such situations. One example of a portable computer device is the "NetBook" computer manufactured by Hewlett Packard Company. A NetBook computer is a personal computer which is capable of being used as a portable device. The "NetBook" has a relatively small form factor, yet the NetBook includes a keyboard for input to the system, and an input device which is integrated in the housing of the device. The mouse device which is used in conjunction with the NetBook computer is known as the "IntelliMouse" ("Intelli" is a trademark of Hewlett Packard Company). In the IntelliMouse, a top surface of the housing of the device slides in and out, to enable and to permit the use of either a keyboard or a mouse to be placed onto and be used with the NetBook. Unfortunately, the IntelliMouse is not suitable for all portable computers, since it may require more space to carry the IntelliMouse, which, in the case of the "NetBook" device, is highly undesirable. Thus, it would be beneficial to be able to combine a keyboard and a mouse device in a single input device./* * Copyright (C) 2015 Apple Inc.
