Note We'll discuss layers in the next section. Figure 12-2. The Photoshop interface is a grid of image tools, sandwiched between two panels that show the image and a panel that displays tools and commands relevant to the current image layer. This kind of view makes it easy to see exactly what tools are on the current image, and you can change tools simply by dragging the cursor over a tool's block. Some tools are controls that apply only to a particular image, such as the Selection tool or the Hand tool.

The present invention relates generally to inspection fixtures, and more particularly to a fixture for providing stereo and, more importantly, automatically perpendicular inspection of metallic fasteners such as drill bit studs. It is known to utilize stereoviewing or 3D imaging in automated systems which are capable of inspecting a number of workpieces such as holes and/or holes containing various drill bit studs to determine if the drill bit studs are drilled in the correct location, at the correct angle and depth, and with the correct diameter. Three-dimensional (3D) imaging is the process of acquiring images of an object from multiple angles and then assembling those images into a single 3D picture. As contrasted with two-dimensional (2D) imaging, 3D imaging produces a three-dimensional model of the structure being imaged. 3D imaging is currently used to generate 3D models of everything from buildings to entire cities, to pieces of machinery and even the human body. Stereoviewing is a 2D imaging procedure that involves capturing images of an object from different angles and then assembling the images to produce a solid image of the object. Stereoviewing systems are used to inspect parts such as holes and components. In the aerospace industry, stereoviewing is an important part of quality inspection of parts. In many inspection systems, the accuracy of the system is limited by the amount of time the inspection systems can spend on each workpiece. For example, there is generally a limitation on how many times each item can be inspected in a period of time. Accordingly, there is a need for an inspection device which would capture significantly more images of each component in a single period of time.

Hi all. We are getting ready to roll out in a big way. Portal 2 is coming in April, and is the first game to be released on Origin. It will be available for all platforms except for Windows Phone and Windows 8. It will be discounted and region free. and I will reveal all the details tomorrow. I have been working on Portal 2 off and on since I left Valve after the release of Portal in 2007. I have looked after the development of Half Life 2 Deathmatch and Portal 2. I am a proud owner of Portal 2, and will not be taking advantage of the awful "pay to win" model that Valve is introducing (pay to win, and micro transactions). I am also one of the guys at the forefront of the

Q: Multiple Form Values in DB Ok...I've seen a lot of these questions and answers here but am having a problem for which I don't find an answer...At least on my situation. I have a form with 4 input (with same name) and 4 submit button, 4 inputs and 4 submit button. My question is how should I save the values from all the four input and the four submit buttons. Because the values of all the 4 inputs and 4 submit button are all the same, how should I proceed? Should I: create 4 fields in the DB (which all are the same) create a single field where I insert all the values at once do something else? Thanks

A: You don't need four different fields in the database. You can simply store all the data in a single field. How you parse the data in and out of the database is up to you.

Antoinette Bryan discusses black theology and women in the black church

By Antoinette Bryan

On a Sunday evening, the Oakland Christian Center overflows with folks eager to hear the featured speaker. Among the crowd is a young couple, newlyweds, who can't find a seat in the packed sanctuary. They decide to stand, in the spirit of patience and offering grace to each other and to other attendees. Later in the evening, as I speak on "Black Theology and Women's Theology," I overhear the young couple whispering to each other in the back. They're discussing this very issue. I've seen this dynamic play out between people all over the country. So much about the nature of the black experience and its history informs the black church, even though these churches are organized differently than white churches, they still have a lot of shared material to talk about. When the young couple moved to Oakland, they had no idea that they would find a community of African-American Christians who questioned conventional understandings of spirituality. When they hear my talk, they're hopeful they'll hear something new. Now, as they're joining the conversation, I get to share my research and thinking about this subject with them. I have no idea what they're thinking about it, but I'm glad that

they are coming along with me. The black church is a unique institution. The nature of
