
Magix Samplitude Music Studio 2013 Serial Number

I have installed and i can see that my serial number is " 000000000000 " so it seems to be working fine. But when i try to connect to the net it says " internet connection time out " i suspect the OS is corrupted. It has been clean installed on a different partition (so now is dual booting) but i also tried and again the same problem. What do you think can be the problem? A: As it seems that you are trying to connect via internet or (if you have another computer / live desktop) to a server while being in a different operating system (dual boot) than the one you are using, the problem could be due to the network connections windows you are using. You should check and see if you have any unnecessary hardware / drivers installed which could cause this conflict. How to do this: In the start menu go to (Windows + R) (if it was ever installed, if not go to the start menu and type cmd.exe and then go to the Run -> type cmd and then Run -) Type cd /tmp (without the quotes. Type dir (this should list a folder called Temp, if not, type cd temp to be in that folder) Type ping google.com (hit the Enter key). If you have a folder called Ping, go to that and then type cmd, and type dir, find the folder called Ping, it may or not have the time in that folder (date and time can be changed as it seems they are set on the program (?), however, they can be cleared or changed using the tools like the date and time tool, or others similar) If you have no folder called Ping, in the Temp folder, or in the Temp folder itself, go to the folder called Temp, and type cmd, and in the Temp folder type dir, find the folder that says Temp, then open it, go into it, and paste the path in the above step 5, (if you need to use the quotes, just add them as ""), copy and paste it in the step below "Find what you're looking for" Find what you're looking for Type net stop ping Type net start ping This could cause additional problems with the OS in which you are using, so you should try to set the network connections and ports as it was before (this could involve a complete removal and installation of the OS
