Electrophotographic printing has been used for many years. In this printing process, a light image is produced on a photosensitive member or belt which may be a coated paper, or

a photoconductive medium which may be an electrostatographic printing plate or a photosensitive drum. The light image is developed and transferred to a printable medium, such as paper, to produce an image. The image may be produced directly on a photosensitive member or belt. In the "on-demand" type, the light image is developed by a set of developing rollers which transfer the image to the photosensitive member or belt which, in turn, passes the image to a transfer roll to transfer the image to a printable medium. This type of system requires expensive and difficult drive mechanisms for the rollers and the photosensitive member or belt. The system of producing the image on the photosensitive member af5dca3d97
