So I'm wondering if there's a way to just display all the entries (keywords) for a particular user? A: This query will help you: $result = mysql_query("SELECT * FROM `Keywords` WHERE user_id = $username"); $data = []; while($row = mysql_fetch_array($result)){ $data[] = array('keyword' => $row['keyword']); } echo json_encode($data); Presently, there are two methods by which to conduct remote video conferencing. One method is to establish a direct connection between the attendees and the remote participants, the other method is to establish a connection between the attendees and the remote participants via a network system. The direct connection method is the best method, because it achieves a significantly better quality. For those networks that lack a satisfactory resolution, however, the connection via a network system is the method of choice. In the connection

via a network system, the screen of the remote participants is connected to the network system, where the remote participants either transmit the screen image, via a video conference or file transfer protocol, to the attendees or receive the video conference from the attendees. The attendees are connected to the network system, usually via a personal computer (PC), either directly or via a client-server application. Consequently, the attendees appear to the remote participants as an enlarged live image, as if they were sitting in the same room. However, when the attendees are using a video conferencing/file transfer protocol such as Microsoft Netmeeting or Adobe Live.sup.(trademark), the attendees are actually using a phone line or network connection and most often have a PC equipped with a speakerphone so that they can carry on a normal conversation and simultaneously watch the screen image, which is recorded and transmitted by the PC. The quality of the video conference is affected by the distance between the attendees and the remote participants. In a remote video conference, the quality is usually limited by the resolution of the PC used in the attendees' room (i.e., the screen resolution). It is possible to obtain a better quality video conference for the attendees and the remote participants by using an alternate PC with a higher screen resolution or a dedicated media board that has a higher resolution screen. However, the cost of obtaining such equipment and the space required for its c6a93da74d
