Here is the description of the problem I have. I have an application which contains Horizontal ListView containing ImageButtons. I am using ImageButtons here because to display images not just a simple ImageView is required. I am loading the images for the first time on the application startup and displaying it as it is. I have given "isTapEnabled" parameter true to the ImageButton. It is good for 5 or 6 ImageButtons displaying on one screen width. Then I am loading image with some specific parameters in the background, these parameters are not changing frequently. Now with this new image loading I have to remove all the ImageButtons from Horizontal ListView on the application startup and dynamically reload all the ImageButtons whenever I have to change the Image. The problem is, will the Horizontal ListView take to much time and force out of Memory? I am not sure, I want some input from those experienced in this field. A: The ImageButton is just an ImageView with a "tap" c6a93da74d
